What this report does not prove

- The operator (THENAR) can decline to log or anchor a record; append receipts and public audit make this detectable, not impossible.
- Checks are heuristics with recorded thresholds; they can be evaded and can err; they are evidence, not proof.
- A signature proves which key signed, not what a sensor measured; captured_at, source and embodiment are claims by the signer.
- Consent onset is recorded; what a buyer may do after onset is governed by the terms document, not by this protocol.
- Anchors depend on the availability of at least one chain carrying the log; the same log is anchored on more than one.

How to check this report yourself

Run `scripts/verify-report.mjs` against the delivered files and this report's JSON, or perform these steps by hand (PLAN §10.10):

1. For each delivered file: $H(\text{fileBytes})$ equals `files[].hash`; rebuild `payloadHash` (§10.4) and compare.
2. Recompute `manifestHash`; if signature present, verify per §10.6 against the org's published key valid at the leaf's first-anchor time.
3. Rebuild the 0x02 preimage from §10.12 + `submittedAt` (delivered in report); leaf hash; inclusion against the report anchor (root,size) read from any chain carrying the log (`indexOfRoot` lookup).
4. Consistency proof from the sealing anchor to the report anchor.
5. Consent non-membership at the report anchor; if revoked, onset.
6. Each claim leaf: inclusion; verifier signature over the claim; `detailHash` matches detail; thresholds present.
7. Corpus inclusion against `corpusRoot`; corpus manifest leaf inclusion; `corpusRoot/corpusManifestHash` equal the on-chain corpus and receipt.
